## August and Summer (June~August 2009, Climate

August and Summer Mean temperatures for the national average are $0.5^{\circ} \mathrm{C}$ and $0.2^{\circ} \mathrm{C}$ lower than normal, respectively.
$\diamond$ August and Summer precipitations for the national average are $57.9 \%$ and $111.6 \%$ relative to normal, respectively.
$\square$ Climate characteristics of August and Summer (June, July, and August), and their long-term trends are analyzed based on 60 Korean meteorological stations (national average) for the period 1973-2009 (1908-2009 in Seoul).
$\square$ August, 2009 climate is as follows:
o For the national average,

- the mean temperature $\left(24.5^{\circ} \mathrm{C}\right)$ is $0.5^{\circ} \mathrm{C}$ lower than normal. The mean maximum $\left(29.0^{\circ} \mathrm{C}\right)$ and the mean minimum $\left(20.8^{\circ} \mathrm{C}\right)$ temperatures are $0.6^{\circ} \mathrm{C}$ and $0.5^{\circ} \mathrm{C}$ lower than normal, respectively.
- the amount of precipitation $(153.5 \mathrm{~mm})$ is $57.9 \%$ relative to normal.
- the average rainy days (11 days) are 1.6 days smaller than normal.
o For Seoul,
- both the mean temperature $\left(25.7^{\circ} \mathrm{C}\right)$ and the mean minimum temperatures $\left(22.4^{\circ} \mathrm{C}\right)$ are $0.3^{\circ} \mathrm{C}$ higher than normal. The mean maximum temperature $\left(29.5^{\circ} \mathrm{C}\right)$ is equal to normal.
- The amount of precipitation ( 285.3 mm ) is $82.0 \%$ relative to normal.
- The average rainy days ( 14 days) are 0.2 days greater than normal.
$\square$ Summer (June, July, and August), 2009 climate is as follows:
o For the national average,
- All of the mean $\left(23.3^{\circ} \mathrm{C}\right)$, mean maximum $\left(28.0^{\circ} \mathrm{C}\right)$, and mean minimum $\left(19.4^{\circ} \mathrm{C}\right)$ temperatures are $0.2^{\circ} \mathrm{C}$ lower than normal.
- the amount of precipitation ( 780.8 mm ) is $11.6 \%$ greater than normal.
- the average rainy days (40.4 days) are 3.6 days greater than normal.
- days with heavy precipitation above $30 \mathrm{~mm} / 1$ hour are 1.7 times greater than normal, making it the second highest record since 1973.
- both days with heavy precipitation above 80 mm /day and above 150 mm /day are 1.6 times greater than normal.
o For Seoul,
- the mean temperature $\left(24.1^{\circ} \mathrm{C}\right)$ is equal to normal.
- the mean maximum temperature $\left(28.1^{\circ} \mathrm{C}\right)$ is $0.3^{\circ} \mathrm{C}$ lower than normal.
- the mean minimum temperature $\left(20.7^{\circ} \mathrm{C}\right)$ is $0.1^{\circ} \mathrm{C}$ higher than normal.
- The amount of precipitation ( 1076.7 mm ) is $33.1 \%$ greater than normal.
- The average rainy days ( 45 days) are 5.7 day greater than normal.
- days with heavy precipitation above $80 \mathrm{~mm} /$ day are 3.8 days greater than normal, making it the second highest record since 1973.

## $\square$ Long term trend of August and Summer climate

o For the national average, mean temperatures of August 2000s is $0.2^{\circ} \mathrm{C}$ higher than that of the 1970, however, for Seoul, the mean temperature of August 2000s is $0.8^{\circ} \mathrm{C}$ higher than that of the 1970s.
o days with heavy precipitation of August (above $30 \mathrm{~mm} / 1$ hour, $80 \mathrm{~mm} /$ day, $150 \mathrm{~mm} /$ day) during 2000s increased approximately 1~2 times compared to those of the 1970s, approximately 1.6~2.6 times for the Summer, both in national average and in seoul.
※ Normal: average from 1971 to 2000.
※ National average is used average values of 60 meteorological stations starting from 1973.
※ In Seoul, data are analyzed from 1908.
※ 1910s: average from 1911 to 1920
※ 1970s: average from 1973 to 1980
※ 2000s: average from 2001 to 2009

Fig. 1. Time series of August temperatures (mean, mean maximum, and mean minimum), and precipitation across the South Korea for the period 1973-2009.
